

## **Electronic data acquisition/processing and process monitoring/control system**

### **RTX or DLoader**

This is a software interface which allows for machine programming, process monitoring and intelligent interactive diagnostics in real time.

The program is called DLoader and can operate in both DOS and Windows.

The current version is compatible with all RTX electronic machines and enables the operator to:

- a. download events from the machine (alarms occurred, pasteurisation cycles completed, number of cones, etc.), with the option of saving the history of the machine's activity in a single log file
- b. download the programming table (e.g. modifiable parameters)
- c. update the machine firmware and software both for special requests and for functional modifications
- d. monitor the operation of the machine in real time (analysing temperature probes, active outputs, levels, HOT, programmed date and time, etc.) and control the machine as if operating the controls from a keypad
